Figure 1A: Mapa Geológico de Puerto Rico

Renken *et al.*, 2002

EXPLANATION

Quaternary deposits		Miocene rocks		Miocene and Oligocene deposits	
	Alluvium		Aymamón Limestone		Mucarabones Sand
	Landslide deposits		Aguada (Los Puertos) Limestone		Juana Díaz Formation
	Beach deposits		Guanajibo Formation		Lares Formation
	Swamp and marsh deposits		Cibao Formation		San Sebastián Formation
	Artificial fill		Montebello Limestone Member	Eocene, Paleocene, and Cretaceous rocks	
	Undifferentiated surficial deposits		Quebrada Arenas Limestone Member—Includes Miranda Sand Member		Volcanic and sedimentary rocks
Pliocene and Miocene rocks			Rio Indio Limestone Member—Includes Almirante Sur Lentil		Plutonic rocks—Mostly quartz diorite and granodiorite
	Quebradillas Limestone		Guajataca Member		Metamorphic (serpentinite), sedimentary, and igneous rocks
	Ponce Limestone				Fault

AGE		Hubbard, 1923	Zapp and others, 1948	Meyerhoff, 1975	Monroe, 1980	Seiglie and Moussa, 1984	This report (subsurface)

EXPLANATION

- Area of outcrop of Lares Limestone
- 100— Line of equal thickness of Lares Limestone—
Interval 50 meters. Dashed where approximately located
- Well control point—Thickness in meters (well name abbreviations on figure 21)
- 75± Outcrop—Thickness in meters

Figure 2: Thickness of Lares Limestone, northern Puerto Rico (outcrop extent modified from Monroe, 1980).

Renken et al., 2002

EXPLANATION

-  **Area of outcrop of Montebello Limestone**
-  **Line of equal thickness of Montebello Limestone Member—Interval 50 meters**
-  **Well control point—Thickness in meters (well name abbreviations on figure 21)**
-  **Outcrop—Thickness in meters**

Figure 3: —Thickness of Montebello Limestone, northern Puerto Rico (outcrop extent modified from Monroe, 1980).

Renken et al., 2002

Vertical scale greatly exaggerated

- EXPLANATION**
- LATE MIOCENE } Tca - Camuy Formation
 - LATE MIOCENE } Tay - Aymamón Limestone
 - LATE MIOCENE } Ta - Aguada Limestone
 - LATE MIOCENE } Tcu - Cibao Upper Member
 - LATE OUGCENE AND EARLY MIOCENE } Tcm - Montebello Limestone Member of the Cibao Formation
 - LATE OUGCENE AND EARLY MIOCENE } Tomu - Mudstone Unit of the Cibao Formation
 - LATE OUGCENE AND EARLY MIOCENE } Tcq and Tcr - Rio Indio and Quebrada Arenas Limestone Members undifferentiated of the Cibao Formation
 - MIDDLE MIOCENE TO EARLY MIOCENE } Tm - Mucarabones Sand
 - MIDDLE MIOCENE TO LATE MIOCENE } Tl - Lares Limestone
 - MIDDLE MIOCENE } Tss - San Sebastián Formation
 - PRE-MID OUGCENE BEDROCK } Tk - Undifferentiated sedimentary and igneous rocks

- LITHOLOGY**
- MUDSTONE
 - MARL LIMESTONE, AND MUDSTONE
 - LIMESTONE
 - CONGLOMERATE AND SAND
 - UNDIFFERENTIATED SURFICIAL DEPOSITS
 - UNDIFFERENTIATED SEDIMENTARY AND IGNEOUS ROCKS

Lares Lm.

San Sebastián Fm.

Fig. 5: The base of the Lares Limestone and its contact with the San Sebastián Formation exposed at the intersection of the Highways PR 10 and PR 6621

Fig. 6: The base of the Lares Limestone and its contact with the San Sebastián Formation exposed at the PR10-PR6621 intersection (N18°18'52", W66°41'05").

Fig. 7: Close-up of the of the Lares Limestone-San Sebastián Formation contact exposed at the PR10-PR6621 intersection. Here the San Sebastián Formation consists of conglomerate, composed of particles ranging from pebbles to cobbles.

Fig. 8: The base of the Lares Limestone and its contact with the San Sebastián Formation exposed at the PR10-PR6621 intersection. Lines of cobbles composed of weathered (oxidized) volcanic rocks follow the apparent dip of the strata.

Fig. 9: An oyster layer at the base of the Montebello Member, mapped by Monroe (1980a), helped to define the Lares Limestone-Montebello Member contact. The oyster layer is readily identifiable throughout the field area.

Fig. 10. The top of the Montebello Member at PR 10 was mapped by Ramirez-Martinez (2000) at an erosional surface located at N 18°23'33", W 66°41'42", in front of the first scenic overlook from Arecibo to Utuado.

Aguada Limestone

Undiferentiated Cibao Formation

Montebello Member of the Cibao Formation

SERIES		STRATIGRAPHIC UNITS	SEQUENCE BOUNDARY
MIOCENE	UPPER		
	MIDDLE	Aymamón Limestone	5
		Aguada (Los Puertos) Limestone	4
	LOWER	Undifferentiated Cibao	3
Montebello Limestone Member, Mudstone unit, Quebrada Arenas and Rio Indio Limestone Members		2	
OLIGOCENE	UPPER	Lares Limestone	
		San Sebastián Formation	
	"MIDDLE"	"San Sebastián Formation" of No. 4CPR	1

Fig. 10. The top of the Montebello Member at PR 10 was mapped by Ramirez-Martinez (2000) at an erosional surface located at N 18°23'33", W 66°41'42", in front of the first scenic overlook from Arecibo to Utuado.

Fig. 11: The presence of freshwater gastropods and erosional surfaces, suggest subaerial exposure at about 305 meters from the base of the Montebello Member. They were used to establish the upper limit of the Montebello Member at the PR10 Highway section.

Physa sp.

Pomacea sp.

Fig. 12: Gastropods identified as belonging to the genera Pomacea and Physa (Galluzzo, personal communication, 1998) present above an erosional surface located at about 295 meters from the base of Montebello Member section on PR10. Both genera are freshwater taxa with no tolerance for salinity and are very common in freshwater units of Tertiary age throughout the Caribbean (Vokes, personal communication, 1998).

Fig. 13: Vertical cylindrical structures just below the bed where freshwater gastropods are present appear to be rhizoliths.

Fig. 14: Large-scale cavities filled with fine carbonaceous mud and carbonate breccias are present below the bed with freshwater gastropods . They are probably Tertiary solution collapse features.

SERIES		STRATIGRAPHIC UNITS	SEQUENCE BOUNDARY
MIOCENE	UPPER		
	MIDDLE	Aymamón Limestone	5
		Aguada (Los Puertos) Limestone	4
	LOWER	Undifferentiated Cibao	
Montebello Limestone Member Mudstone unit Quebrada Arenas and Río Indio Limestone Members		3 2	
OLIGOCENE	UPPER	Lares Limestone	
	"MIDDLE"	San Sebastián Formation	1
		"San Sebastián Formation" of No. 4CPR
